 EEE 4103: Microprocessor and Embedded Systems Laboratory

Title: Familiarization of assembly language program in a microcontroller.

Introduction: In this experiment, the main objective is to learn how to write an assembly program for a blink program in a microcontroller.

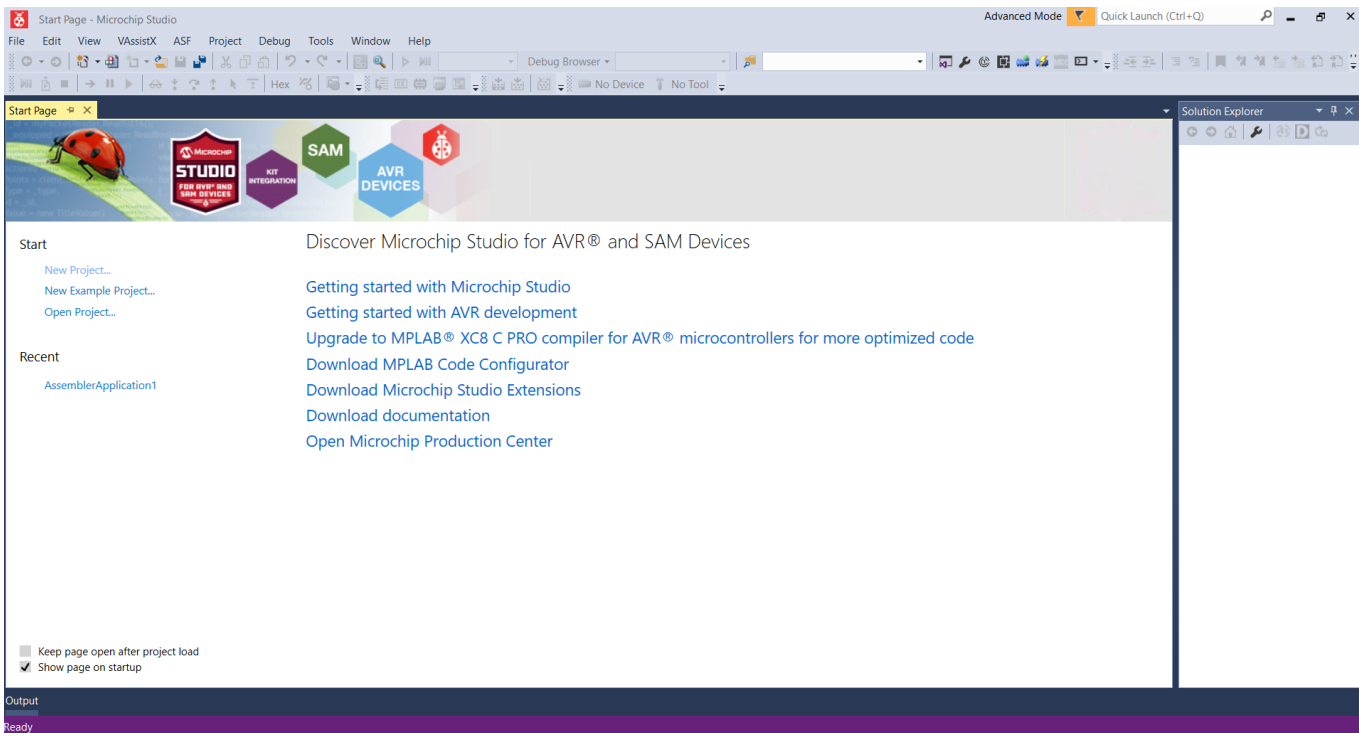

Theory and Methodology: The idea is to implement a blink using assembly language programs.

Equipment:

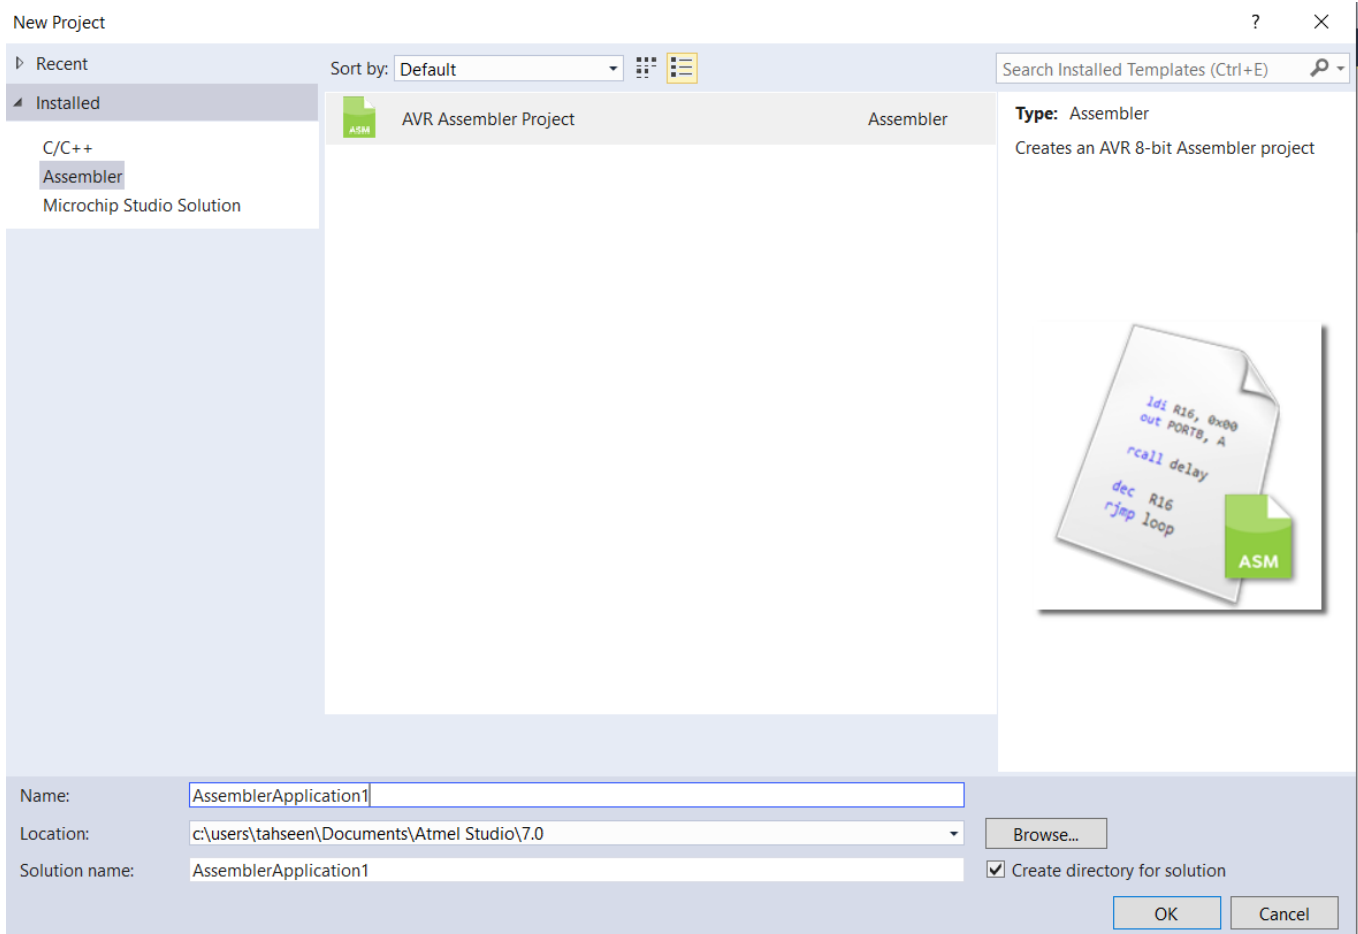

- 1) Microchip studio [ver.7]
- 2) PC having Intel Microprocessor

Lab Procedure:

- 1) From the start up homepage of the software, new project must be selected.

- 2) Select AVR 8-bit assembler for ATmega328P and save the file in a directory as follows:

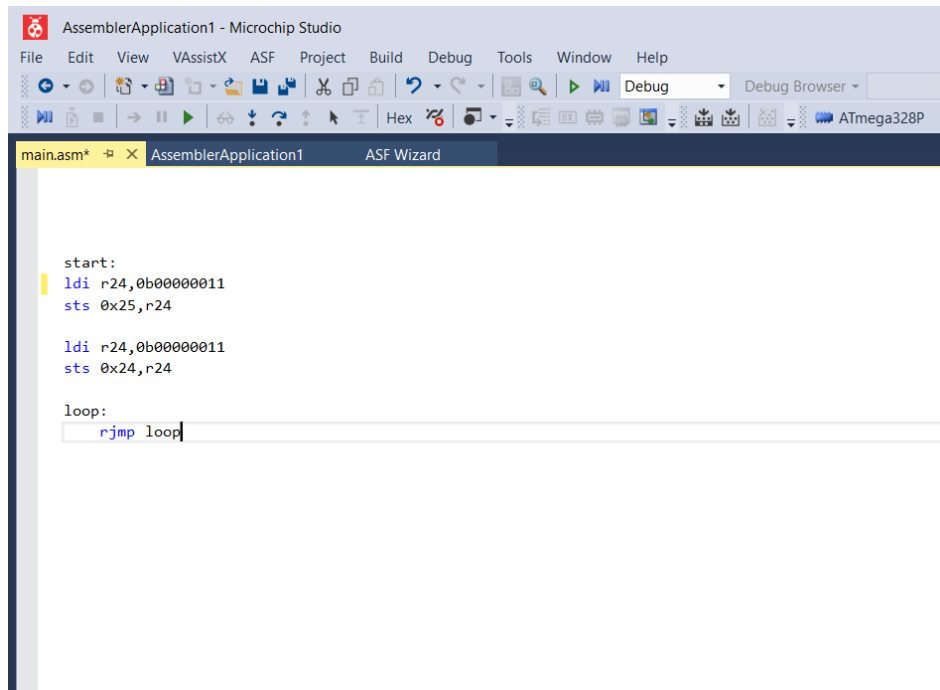

3) Now write the following program in the main.asm file editor as follows:

```
start:
ldi r24,0b000000011
sts 0x25,r24

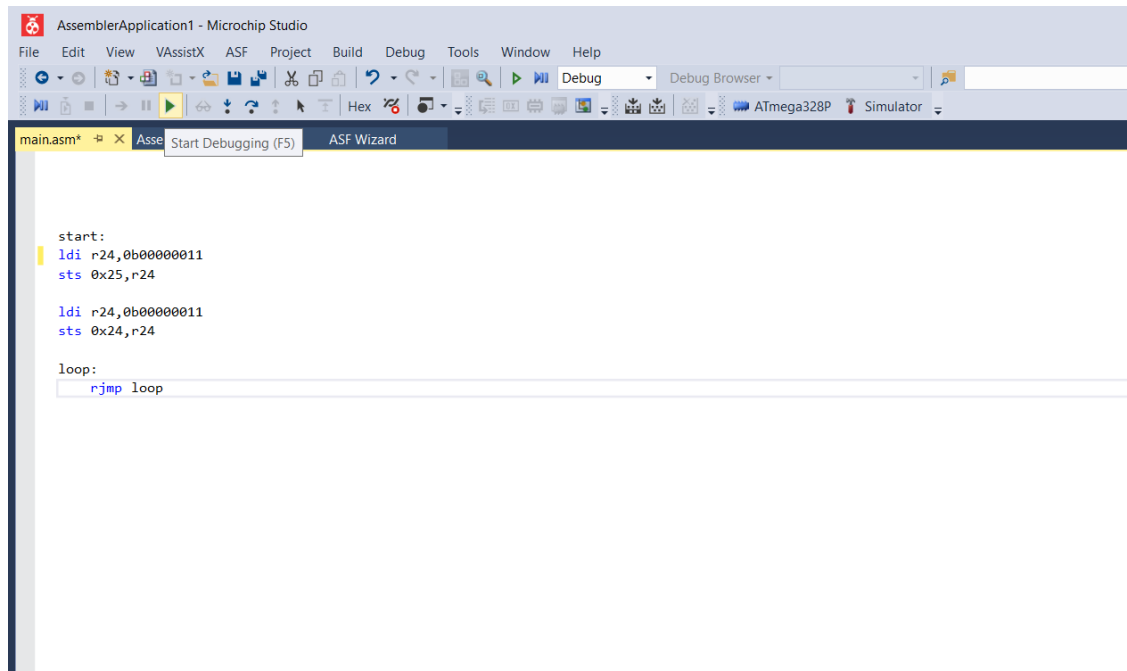

ldi r24,0b000000011
sts 0x24,r24

loop:
rjmp loop
```

- 4) Connect the hardware implementation as below circuit connection and then select start debugging for seeing the results in circuit.

Lab Task:

- 1) Now upgrade the program as follows and observe the changes in LED blinking in hardware implementation.

```
start:
ldi r24,0b00000010
sts 0x25,r24

ldi r24,0b00000011
sts 0x24,r24

loop:
rjmp loop
```

- 2) Now upgrade the program as follows and observe the changes in LED blinking in hardware implementation.

```
start:
ldi r24,0b00000000
sts 0x25,r24

ldi r24,0b00000011
sts 0x24,r24

loop:
rjmp loop
```

- 3) Now upgrade the program as follows and observe the changes in LED blinking in hardware implementation.

```
start:
ldi r24,0b00000001
sts 0x25,r24

ldi r24,0b00000011
sts 0x24,r24

loop:
rjmp loop
```

Questions for Report writing:

1. Include all codes' list file printouts following lab report writing template mentioned in appendix A.
